

# HEREDITARY CANCER RISK ASSESSMENT

The Fertility and Midwifery Care Center Offers Screening, Counseling and Testing to Diagnose Hereditary Cancer Syndromes for women with a family or personal history of breast, ovarian, and uterine cancers. Certain gene mutations are passed on among families that put patients at an extremely significant risk for development of cancer in their lifetime. A simple blood sample for BRCA testing and Lynch Testing can determine whether a patient has these mutations so that proactive steps can be taken to reduce their cancer risk or even to prevent cancer from developing altogether in themselves and/or their family members

We suggest all women complete a confidential, secure online quiz customized for patients of the Fertility and Midwifery Care Center that will communicate your results directly to Drs. Stroud and Martin. [Click here to take the online quiz](#)

Our staff will contact you once the results of your quiz have been evaluated to schedule a consultation visit to discuss your specific risks. We see the prevention and early detection of these cancers as a fundamental part of our mission to provide women the absolute best care possible and we look forward to working with you on this critically important project.
